

How Health Link Works

1. A Simple Procedure.

Health Link is inserted just under the skin, like a shot, in the back portion of the upper right arm between the elbow and shoulder. The procedure is quick, easy, and safe. It is performed by a doctor or nurse practitioner, with no recovery time necessary.

2. Secure Database.

Use your unique 16-digit Health Link ID number and your confidential username and password to access Health Link's secure database to input and save your personal, medical, emergency contact and other information. You can also have someone you trust input information for you.

3. In Case of Emergency.

If you have a medical emergency and are brought to the hospital unable to clearly communicate, emergency room doctors and nurses can identify and learn about you by scanning your right arm with a special Health Link Scanner. The scanner locates your Health Link and provides your unique 16-digit Health Link ID number to emergency personnel.

4. Access to Your Health Record.

Once your unique 16-digit Health Link ID number is retrieved, emergency room doctors and nurses enter your Health Link ID number, along with the hospital's own confidential username and password, into Health Link's secure database. This allows them immediate access to your personal health record, containing your medical and emergency contact information.

5. Medical Care.

The information stored in your personal health record can help emergency room doctors and nurses treat you quickly, accurately and safely.
